New nucleic acid molecule useful for treating disease, e.g. infertility, impotence, or testicular cancer.

Claim 17; Page 40; 61pp; English.

The present sequence represents an epitope-bearing portion of human dibroblast growth factor-21 (FGF-21). FGF proteins regulate growth and differentiation of a variety of cell types. FGF-21 nucleic acids and polypeptides are useful for treating diseases and disorders characterised by inadequate numbers of hepatic cells, preferably cirrhosis of the liver. They may also be used in the treatment of infertility, impotence, and testicular cancer, as well as leukemia, lymphoma, autoimmune disease, or proliferative disorders of the thymus

Sequence 15 AA;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The present invention describes an active variant (1) of a fibroblast growth factor (FGF) having at least one mutation in the beta-9-beta-9 loop, having enhanced specificity for one receptor subtype compared to the corresponding wild type FGF, by decreasing the biological activity mediated by at least one receptor subtype while retaining the activity mediated through another receptor subtype while retaining the activity of succepturing a mediated through another receptor subtype. (1) has cytostatic, vulnerary, of vasculogenesis or angiogenesis. (1) is useful for preparing a mediacement and for treating a disease or disorder related to normal or abnormal FGF receptors (FGFRs), especially skeletal disorders, cancer, to chance bone fracture healing or bone growth processes and wound healing processes. (1) is useful in detection and treatment of various FGFR related disorders including skeletal disorders e.g. achondroplasia, hypochondroplasia, and osteoporosis, and cartilage defects, multiple myeloma, epithelial cancers such as transitional cell carcinoma of the bladder and cervical carcinoma. The novel mutants are useful in high expression systems suitable for pharmaceutical production, targeting of drugs or other agents to tissues and cells having specific FGFRs subtypes, and serve as template for the formation of improved agonists and cancers and and serve as template for the formation of improved agonists and
                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New variants of fibroblast growth factor, useful for treating skeletal disorders including osteoporosis, malignancies and to enhance wound and

```
The sequence represents a fragment of a fibroblast growth factor-like (FGF-like) polypeptide. FGF-like protein and its associated nucleic acid play a role in modulating body growth, maturation or life-span. They are also useful for treating, preventing or ameliorating disorders such as cirrhosis, inflammatory bowel disease, mucositis, Crohn's disease, clasease, damage to renal tubules as a result of acute tubular necrosis, hematopoietic cell reconstitution following chemotherapy, wasting cardines (e.g., cancer associated cachexia), damage to the corneal cyndromes (e.g., cancer associated cachexia), damage to the corneal captalium, lens or retinal tissue, multiple sclerosis, myopathies, short stature, delayed maturation, excessive growth (e.g. acromegaly), cremature maturation, acute respiratory distress syndrome, tumours of the eye or other tissues, atherosclerosis, hypercholesterolemia, crock of the eye or other tissues, atherosclerosis, hypercholesterolemia, carches, osteoporosis, osteoarthritis, muscle atrophy, sarcopenia, baldness, wrinkles, increased fatigue, decreased stamina, decreased cardiac function, immune system dysfunction, cancer, Parkinson's disease,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel isolated polypeptide (NOVX) comprising mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, anorectic, cardiant, hypotensive, antiarteriosclerotic, anorectic, virucide, antibacterial, fungicide, protozoacide, nootropic,
senile dementia, Alzheimer's disease, and decreased cognitive function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obseity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.
                                                                  Gaps
                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Zhong M, Guo X, Anderson DW, Ort T, Padigaru M, Rieger DK;

cc neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antiathratic, antinflammatory, dermatological, antiathratic, antiaflammatory, dermatological, antiathratic, antiaflammatory, dermatological, antiathratic, antiaflammatory, dermatological, antiathratic, antiaflammatory, dermatological, antiaflammatory as use in gene therapy. The polympetides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome cassociated with a human disease, preferably a NOX.associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or disgnosing diseases such as metabolic disorders, diabetes, obesity, infectious diseases, crital, bacterial, fungal, helmithic, and protozoal), anorexia, cancer, cardiovascular diseases (helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (soliepsy, inferentiation) and various dyslipdaemias. The nucleic acide and polypeptides at the modulate or inhibit e.g. neurogenesis, cell differentiation, cell casthma, and various dyslipdaemias. The nucleic acide and polypeptides constants of antibodies that bind immunospecifically to Noving substances for use in therapeutic or diagnostic methods. The nucleic cacids are further used as hybridistion probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenemics. The Noving substances for use in therapeutic or diagnostic methods. The nucleic cords are further used as hybridistion probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenemics. Novia shows homology to fibroblast growth factor receptor (PGFR4); NOV2a shows homology to fibroblast growth factor: NOV3a shows homology to complement factor I precursor; NOV3a shows homology to tibroblast growth factor.

(PGFR4); NOV3a-1 show homology to tibroblast growth factoriants (PGFR4); NOV3a-3 show homology to tibroblast growth factoriants precursor; NOV3a-5c show homology to tibroblast growth factoriants precursor; NOV3a-1 show homology to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; fibroblast growth factor; FGF; zFGF11; chromosome 19; restenosis; proliferation; mesenchymal cell; osteoblastic lineage cell; osteoporosis; chromosomal disorder; chondrosarcoma; atherosclerosis; obesity; fracture; bone formation; diabetes mellitus; neural cell development; anglogenesis; amyotrophic lateral sclerosis; cerebrovascular stroke; neuropathy; ulcer; congenital disorder; wound healing; cardiac function; glomerulonephritis; surfactant production; anorecic; ischaemia; neogenesis; hyperplasia; hypertension; cytostatic; vasotropic; therapy.

Trepression agreements in the control of the control of the cells. StGRII general is located on chromosomal 19. StGRII is useful for stimulating proliferation of mesenchymal cells, osteoblastic lineage cells. StGRII is useful for identifying chromosomal disorders associated with abnormal expression of stGRII protein. StGRII is also useful for stimulation, inhibition or proliferation of myocytes, smooth muscle adjacents, cells, and neuronal progenitors, pancreatic cells, prostatederived cells and neuronal progenitors, pancreatic cells, prostatederived cells and endothelial cells and inhibiting chondrosarcomas, catherosclerosis and obseity. Stimulation of osteoblasts restences and obseity. Stimulation of osteoblasts cresults in bone formation useful for treating bone defects, fractures, osteoporosis and other deficiencies in bone structure and formation.

STGRII is useful for treating disorders associated with diabetes mellitus, neural cell development or degeneration, amyotrophic lateral schenois and encronal differentiation and congenital disorders of the nervous system or lack of neuronal development, promoting angiogenesis and wound healing, for reveascularisation in eye, complications related to poor circulation such as diabetic food ulcers, improving cardiac function, modulating surfactant production in the lung epithelium, to reduce damage to the tissue caused by ischaemia or ischaemia-reperfusion events, particularly in the heart or brain and for inducing skeletal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present sequence is human fibroblast growth factor (FGF) homologue, F11 protein. zFGF11 gene is located on chromosome 19. zFGF11 is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel zFGF11 polypeptide and polynucleotide, a member of fibroblast growth factor family, for stimulating proliferation of mesenchymal, osteoblastic lineage cells and treating diabetes, obesity, osteoporosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 muscle neogeneess and/or hyperplasia, kidney regeneration and/or for treating of systemic and pulmonary hypertension. Antagonists of zPGF11 are useful for inhibiting disorders associated with kidney epithelium

stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating or inhibiting the proliferation of normal human dermal fibroblast cells. The PRO polypeptide may also be used as molecular weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. AAU83592-AAU83713 represent human PRO protein sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for treating a PRO related disorder and for diagnosing tumors such as lung cancer, colon cancer, breast tumor, prostate tumor, rectal tumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polymucleotides encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in pericyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gerritsen ME, Goddard A, Godowski PJ;

(I) and (II) are used in methods of the invention stimulating proliferation of mesenchymal cells, dececting the presence of regril in a biological sample and stimulating proliferation of estemble of the invention in a biological sample and stimulating proliferation of osteoblastic lineage cells. The polypeptides, nucleic acid and/or antibodies of the invention may be used in treatment of disorders associated with diabetes mellitus, neural cell development or degeneration, anyotrophic lateral sclerosis, cerebrovascular stroke, neuropathy associated with lack of maintenance of neuronal differentiation, and congenital disorders of the nervous system or lack of neuronal development. Molecules of the invention may also be useful for improving cardiac function and for promoting wound healing of the epidermis. The present sequence represents the amino acid sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Mature fibroblast growth factor homologue, zFGF11. This sequence is specifically claimed in claim 4"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cell; FGFRIIIC;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated human polypeptide (1) for zFGF11 (a fibroblast growth factor), and the encoding polynucleotide (II). (I) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; fibroblast growth factor; FGF; zFGFI1; mesenchymal cell; FGFRIII ostcoblastic lineage cell; diabetes mellitus; neuropathy; neural cell cell celloster, amyotrophic lateral sclerosis; cerebrovascular stroke; neuronal differentiation; congenital disorder; nervous system disorder; cardiac function; wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated polypeptide for zRGF11 (fibroblast growth factor) useful in treatment of disorders associated with diabetes mellitus, neural cell development or degeneration, amyotrophic lateral sclerosis,

The present invention relates to new extracellular messenger polypeptides and polynucleotides encoding them. XMES is useful in the diagnosis, treatment and prevention of neurological disorders (e.g. epilepsy, stroke, or Alzheimer's disease), autoimmune/inflammatory disorders (e.g. equired immune deficiency syndrome, AIDS, Addison's disease, or allergies), developmental disorders (e.g. renal tubular acidosis, anaemia or Cushing's syndrome), endocrine disorders (e.g. hypophysectomy, ancurysm or vascular malformation), and cell proliferative disorders (e.g. cancer), and in the assessment of the effects of exogenous compounds on the expression of nucleic acid and maino acid sequences of extracellular messengers. XMES may also be used in the treatment of viral, bacterial, fungal, parasitic, protozoal and helminthic infections, trauma, disorders associated with hypopituitarism, thypothyroidism, hyperthyroidism or gonadal steroid hormones, and pancreatic disorders such as type II diabetes mallitus. The XMES may be used for somatic or germline gene therapy. The present

The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the diagnosts and treatment of tumours. Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific calls, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABUS0739-ABUS0860 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                              Human; PRO polypeptide; secreted and transmembrane protein; anti-PRO antibody; diagnostic assay; gene expression; tumour; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gerritsen ME, Goddard A, Godowski PJ;

The invention describes an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide comparing e.g. 4834, 2504 or 1759 bp fully defined in the sequences. The PRO polypeptides or polynucleotides are useful sequences. The PRO polypeptides or polynucleotides are useful cas pharmaceuticals, diagnostics, blosensors or bioreactors. These are particularly useful for detecting tumours (e.g. lung tumour, colon tumour) for stimulating the release of TMP-alpha from human blood, in a mammal, for stimulating the release of TMP-alpha from human blood, colls, for stimulating proliferation or differentiation of chondrocyte cells, for stimulating proliferation or differentiation of chondrocyte cells, for stimulating proliferation or differentiation of chondrocyte colls, encoural human dermal fibroblast proliferation. The PRO nucleic acid or polypeptide is also useful for treating tumours or various bone and/or cartilage disorders (e.g. sports injuries or arthritis), or wounds. The PRO polypeptides are useful in drug screening, particularly as targets of the therapeutic intervention in these diseases, and in the diagnostic cartilage disorders (e.g. sports injuries or arthritis), or wounds. CC arthriation. The PRO genes are useful as hybridisation probes, or for identification. The PRO genes are useful as hybridisation probes, or for also useful as molecular weight markers, or for chromosome calso useful in gene therapy, particularly for replacing a defective comes also be used in an enhance of a novel human secreted and transmembrane PRO polypeptide equence of a novel human secreted and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New genes, and its encoded secreted and transmembrane polypeptides, useful for stimulating Tumor Necrosis Factor alpha, or chondrocyte or pericyte proliferation, especially for treating lung tumors, arthritis or wounds in a mammal.
                                                                                                                                                                                                                                                                                                    Human; secreted and transmembrane protein; PRO; cytostatic; antiarthritic; osteopathic; gene therapy; TWP-Agonist-Alpha; chondrocyte stimulator; pericyte stimulator; fibroblast modulator; pharmaceutical; diagnostic; biosensor; bioreactor; tumour; lung tumour; colon tumour; breast tumour; prostate tumour; rectal tumour; liver tumour; bone disorder; cartilage disorder; sports injury;

The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, agerelated macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gerritsen ME, Goddard A, Godowski PJ;

The present sequence represents human fibroblast growth factor 21 (FGF-21). FGF-21 is located to chromosome 19, more specifically to 19q13.1-qter. The present invantion describes a method for treating a mammal exhibiting type 2 diabetes or type 1 diabetes, or treating a mammal for obesity which comprises administering to the mammal a composition comprising FGF-21 which has at least 95% amino acid sequence identity to the 208 amino acid sequence given in ABP96156. Also described: (1) inducing an increase in glucose uptake in adipocyte cells by administering FGF-21 to induce an increase in glucose uptake; and (2) administering medicament for treating type 1 diabetes, type 2 diabetes or obesity in a mammal using FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 having 95% amino acid sequence identity for treating a mammal for obesity. The method is preferably useful for treating humans exhibiting type 1 or type 2 diabetes, and for treating domestic animals for obesity

The invention relates to a novel isolated PRO protein encoding nucleic acid. The nucleic acid of the invention may be useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a tumour in a mammal. Furthermore, the molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells, the release of tumour necrosis factor (TNF)-alpha from human blood, the proliferation or differentiation of chondrocyte cells and for inhibiting the proliferation of normal human dermal fibroblast cells. Finally, the molecules may be utilised during gene therapy. The current sequence is that of the human PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                      Gerritsen ME, Goddard A, Godowski ÞJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel isolated nucleic acid encoding a fully defined PRO polypeptide. The molecules of the invention may be useful for stinulating proliferation or gene expression in pericyte cells or the release of TNF-alpha from human blood. Other possible uses include the stimulation or inhibition of chondrocyte proliferation or differentiation, the stimulation of human dermal fibroblast cell proliferation and the detection of the presence of a tumour within a mammal. Purthermore, the nucleic acid may be useful for the manufacture of a medicament for diagnosing or treating a tumour within a mammal or for measuring or detecting the expression of an associated gene, as well as during gene therapy. The current sequence is that of the human PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid encoding for a PRO protein, useful for the manufacture of a medicament for diagnosing or treating tumors or for measuring or detecting expression of an associated gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gerritsen ME, Goddard A, Godowski PJ;

```

polypeptide. Nucleic acids that encode PRO can be used to generate either transgenic animals or knock-out animals useful in developing and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy for replacing defective gene, in chromosome identification, as chromosome markers, or in generating probes to isolate full length PRO cDNA. The PRO polypeptides are useful for chondrocyte stimulation, TWF-alpha stimulation, human dermal fibroblasts stimulation and for detecting the presence of thmour in an mammal. The PRO polypeptides are useful as molecular markers for protein electrophoresis and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO and in affinity purification of PRO from recombinant cell culture or natural sources. The present sequence represents the amino acid sequence of a human secreted/transmembrane PRO polypeptide The invention relates to an isolated nucleic acid encoding a PRO

Sequence 33, Application US/09901938

Patent No. US20020156001A1

GENERAL INFORMATION:

APPLICANT: WHITE, Kenneth

APPLICANT: STROM, Thomas

APPLICANT: STROM, Thomas

TITLE OF INVENTION: NOVEL FIBROBLAST GROWTH FACTOR (FGF23) AND METHODS FOR USE

FILE REFERENCE: 053864-5001,

CURRENT APPLICATION NUMBER: US/09/901,938

CURRENT FILING DATE: 2001-07-10

PRIOR FILING DATE: 2000-07-19

NUMBER OF SEQ ID NOS: 34

SOFTWARE: PatentIn version 3.0

SEQ ID NO 33

LENGTH: 136
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 3, 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 31822, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
ATITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

New human nucleic acid encoding fibroblast growth factor-like peptide, useful for treatment and diagnosis of e.g. wounds and inflammatory bowel disease.

Disclosure; Fig 3; 172pp; English.

The invention provides human nucleic acids encoding fibroblast growth factor (FGF)-like peptide. The FGF-like polypeptides can be expressed by standard recombinant methodology and are mitogenic for a wide range of cells, inducing differentiation and proliferation, and inhibiting deposition of fat. The FGF-like polypeptides, polynuclectides and apperition artibodies and modulators are useful for treating a very wide range of diseases and conditions, e.g. wounds, ulcers, skin aging, obesity, diabetes, alopecia, inflammatory bowel disease, emphysema, viral hepatitis, multiple sclerosis, respiratory distress syndrome, tumors of the eye, etc., also for maintaining organs before transplant and supporting culture of primary cells and tissues.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a human fibroblast growth factor-21 (FGF-21). FGF proteins regulate growth and differentiation of a variety of cell types. FGF-21 nucleic acids and polypeptides are useful for treating diseases and disorders characterised by inadequate numbers of hepatic cells, preferably cirrhosis of the liver. They may also be used in the treatment of infertility, impotence, and testicular cancer, as well as leukemia, lymphoma, autoimmune disease, or proliferative disorders of the
                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleic acid molecule useful for treating disease, e.g. infertility,

The invention relates to fibroblast growth factor (FGF)-like polypeptides and nucleic acid molecules encoding such polypeptides. Sequences of the invention are useful for treating, preventing or ameliorating a medical condition. They are useful for treating dermal wounds, epidermolysis, bullosa, male pattern alopecia, gastric ulcer, duodenal ulcer, erosive agastriis, oseophaguis, inflammatory busel. Inflammatory bowel disease, Crohn's disease, radiation- or chemotherapy-induced gut toxicity, hyaline membrane disease, necrosis of the respiratory compilered by pulmonary fibroasis, chepatic cirrhosis, toxic insults to the liver, fulminant liver failure, viral hepatitis, mucositis, multiple sclerosis and other currhosis, toxic insults to the liver, fulminant liver failure, viral hepatitis, mucositis, multiple sclerosis and other contropulmonary dysplasia, acute respiratory distress syndrome or other bronchopulmonary dysplasia, acute respiratory distress syndrome or contropulmonary dysplasia, acute respiratory distress syndrome or contropulmonary dysplasia, eximilating angiogenesis, promoting wound healing, modulating differentiating or ameliorate skin aging, concentring hair loss, stimulating and maintaining organs before transplanteation and for supporting cultures of primary cells and tissues. Cransplanteation and for supporting cultures of primary cells and tissues. Sequences of the invention are also used in gene therapy and as vaccines.

bowel disease such as Crohn's disease, hyaline membrane disease of premature infants, smoke inhalation, emphysema, hepatic cirrhosis and thymic epithelial atrophy. The nucleic acids may also be used to map locations of FGF-like gene and related genes on chromosomes. The present sequence represents a human FGF protein.

contractic, cardiant, hypotensive, antiatremiosolerotic, anorectic, cardiant, hypotensive, antiatremiosolerotic, anorectic, cardiant, hypotensive, antiatremiosolerotic, anotropic, riucide, antibacterial fungicide, profozoacide, noctropic, neuroprotective, antiparkinsonian, anticonvolusant, osteopathic, antiathritic, antiinflammatory, dermatological, antiatehmatic, and antiphodises antiparemic activity. A polymuclectide of the invention may have a use in gene therapy. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or disposing diseases such as metabolic disorders. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or disease, pelippy, immune disorders, dispetes, obesity, infectious diseases (viral, bacterial, fungal, thematoropoletic diseases (polippy, immune disorders (states that modulate or inhibit e.g. neurospenseis, inflammatory skin disorders, asthma, and various dyslipidaemais. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules context may also be used as targets for the identification of small molecules proliferation, haematopolesis, wound healing and angiogenesis, in gene trianger of the invention alow homology to certain known human proteins of the invention show homology to certain known human context (FGF44); NOV3a shows homology to matrix metalloproteinase-15 precursor; NOV4a shows homology to matrix metalloproteinase-15 precursor; NOV4a shows homology to matrix metalloproteinase-15 precursor; NOV4a shows homology to complement factor I precursor; NOV4a shows homology to complement factor I precursor; NOV5a-15 show homology to involuse and shows homology to involuse-ga show homology to involuse protein-like; NOV12a-11s in precursor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                 The invention relates to a novel isolated polypeptide (NOVX) comprising mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic,
                                                                              New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CSFRELLLEDGYNVYQSEAHGLPLHLPGNKSPHRDPAPRGPARFLPLFGLPPALPEPPGI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, and an antidiabetic, and an antidiate of the invention has an antidiabetic, an an antidiate, antibacterial, fungicide, protozoacide, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopsthic, antiarthritic, antiniflammatory, dermatological, antiaschmatic, and antilipaemic activity. A polynucleotide of the invention may have a use an gene herapy. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders
                                                                                                                                                                                                                                                                                                                                                fibroblast growth factor receptor 4; FGFR4; complement factor I precursor; matrix metalloproteinase-15 precursor; MDC3; T-lymphocyte surface antigen Ly-9 precursor; fibroblast growth factor-21; FGF-21; alpha-2 macroglobulin-like polypeptide variant; antileukoproteinase I precursor; LIV-1; nuclear hormone receptor NOR-1; transmembrane protein-like; beta-neoendorphin-dynorphin precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,
                                                                                                                                                                                                                                                             antiarteriosclerotic, anorectic, virucide, antibacterial; fungicide, protozoacide, noctropic, neuroproecetive, antiparkinsonian, anticonvulsant; osteopathic; antiarthritic; antiinflammatory; dermatological; antiasthmatic; antilipaemic; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rieger DK;

Toberoatimitally, inseminatorpolate to the identification of small utboulders, and various dyslipidaemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to Novx substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The NoVX polypeptides of the invention show homology to certain known human proteins: NoVa-1t show homology to certain known human chochens: NoVa-1t show homology to certain known human chochens: NoVa-1t show homology to certain known human chochens: NoVa-1t show homology to certain known human chomology to matrix metalloproteinase-15 precursor; NoVa-6-6m show homology to fibroblast growth factor-21 (FGFR4); NoV7a-7c show homology to fibroblast growth factor-21 (FGF-21); NoV7a-7c show homology to antileukoproteinase 1 precursor; NOV9a-9; show homology to beta-necendorphin cransmembrane protein-11ke; NOV12a-12c show homology to beta-necendorphin cransmembrane protein-11ke; NOV12a-12c show homology to beta-necendorphin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CSFRELLLEDGYNVYQSEAHGLPLHLPGNKSPHRDPAPRGPARFLPLPGLPPALPEPPGI 180

                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                              셤
                                                                                        ð
                                                                                                                                                                ð
                                                                                                                                                                                                                                         ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the appecification. A polypeptide of the invention has antidiabetic, ancertic, cardiant, hypotensive, antiarteriosclerotic, ancertic, viruded, antibaterial, fungicide, procozoacide, noctropic, antibaterial fungicide, procozoacide, noctropic, antibaterial fungicide, anticonvulsant, osteopathic, antibaterial fammatory, dematological, antiasthematic, and antibamentory. A polypeptide of the invention may have a use utilipaemic activity, A polypeptides and antibodies are useful for are useful in the manuacture of medicament for treating a syndrome associated with a human disease, preferably a NOVA associated disorders, the associated with a human disease, preferably a NOVA associated disorders, clabetes, obesity, infectious diseases such as metabolic disorders, increating, preventing or disponsing diseases und antibodies are useful for treating, preventing or disponsing diseases und antibodies are useful for clabetes, obesity, infectious diseases und antibodies and procozoal), anonexaia, nand various dyslipaemias. The nucleic acid and polypeptides of disease, parkinson's disease, epilepsy, immune disorders, in generation, haematopoiesis, wound healting and angiogenesis, in generation, haematopoiesis, wound healting and angiogenesis, in generation, haematopoiesis, wound healting and angiogenesis, in procozoa shows homology to fibroblast growth factor receptor (FGF4); NOV2a shows homology to fibroblast growth factor: 1 precursor; NOV3a shows homology to fibroblast growth factor: 1 precursor; NOV3a shows homology to militalexical for the invention show homology to libroblast growth factor: 1 procursor; NOV3a-5c show homology to libroblast growth factor: 1 precursor; NOV3a-5c show homo
                                                                                                                                                                                                                                                                                                                                                                                        New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.
                                                                                                                                                                                                                                                                                                 Rieger DK;

antidiabetic; anorectic; cardiant; hypotensive;

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, anorectic, cardiant, hypotensive, antiatrateriosclerotic, anorectic, cardiant, hypotensive, antiatrateriosclerotic, anorectic, antiabacterial, fungicide, protozoacide, nootropic, contrarthritic, antialparkinsonian, anticonvollashit, oscopathic, antialpamentory, demanciolagical, antiasthmatic, and antiabodies antilapaemic activity. A polymucleotide of the invention may have a use in gene therapy. The polypeptides, nucleic acid molecules and antiabodies are useful in the manufacture of a medicament for treating a syndrome contraction of applyabitides, nucleic acid molecules, polypeptides and antiabodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders. Cr treating, preventing or diagnosing diseases such as metabolic disorders, chelmithic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders Alzheimer's costeoarthritis), haematopoiesis, neurodegenerative disorders, and various dyslipidaemias. The nucleic acids and polypeptides costhat modulate or inhibit e.g. neurogenesis, call differentiation, cell cratary, in generation of antibodies that bind immunospecifically to NoVX substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as targets for the identification of small modecules of the invention show homology to certain known human crisus novital shows homology to certain known human crisus involval shows homology to certain known human crisus shows homology to certain growth receptor acids shows homology to certain receptors. predirsor; NOV9a-91 show homology to LIV-1 protein; NOV10a shows homology to nuclear hormone receptor NOR-1; NOV11a-11j show homology to transmembrane protein-like; NOV12a-12c show homology to beta-neoendorphin-dynorphin precursor. The present sequence represents a NOVX polypeptide (FGFR4); NOV2a shows homology to complement factor I precursor; NOV3a shows homology to matrix metalloproteinase-15 precursor; NOV4a shows homology to MDG3, NOV6a-5c show homology to T-lymphocyte surface antigen Ly-9 precursor; NOV6a-6m show homology to fibroblast growth factor-21 (FGF-21); NOV7a-7c show homology to alpha-2 macroglobulin-like polypeptide variant; NOV8a-8g show homology to antileukoproteinase 1

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, anorectic, cardiant, hypotensive, antiarterioaclerotic, anorectic, anorectic, cardiant, hypotensive, antiarterioaclerotic, anorectic, virucide, antibacterial, fungicide, protozoacide, nootropic, cardiathritic, antinflammatory, dermatological, antiasthmatic, and antiarthritic, antinflammatory, dermatological, antiasthmatic, and antibacted of the invention may have a use in gene therapy. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder.

The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders asthma, and various dyslipidaemias. The nucleic acids and polypeptides asthma, and various dyslipidaemias. The nucleic acids and polypeptides that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene colleration of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnosic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, these transity and physiciant or diagnosic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, these transity and the proposes and the particular of the proposes. antiatrenforclerotic; anorectic; virucide; antibacterial; fungicide; protozoacide; nootropic; neuroprotective; antibacterial; fungicide; protozoacide; nootropic; neuroprotective; antibarkinsonian; anticonvulsant; osteopathic; antiatrhitic; antinflammatory; dermatcological; antiasthmatic; antilipaemic; gene therapy; fibroblast growth factor receptor 4; FGRR4; complement factor I precursor; matrix metalloproteinase-15 precursor; MDC3; T-lymphocyte surface antigen Ly-9 precursor; fibroblast growth factor-21; FGF-11; alpha-2 macroglobulin-like polypeptide variant; alpha-2 macroglobulin-like polypeptide variant; antileukoproteinase 1 precursor; L'1; nuclear hormone receptor NOR-1; transmembrane protein-like; beta-neoendorphin-dynorphin precursor. New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections. tissue typing, preventive medicine, and pharmacogenomics. The NOVX polypeptides of the invention show homology to certain known human proteins: NOVIa-1t show homology to fibroblast growth factor receptor Rieger DK; Ort I, Padigaru M, Claim 1; SEQ ID NO 72; 214pp; English. The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the apecification. A polypeptide of the invention has antidaberia.

CC anorectic, cardiant, hypotensive, antiarteriosclerotic, anorectic, cardiant, hypotensive, antiarteriosclerotic, anceropic, antidaterial, fungicide, protozoacide, noctropic, antidaterial, fungicide, protozoacide, noctropic, antidaterial, fungicide, protozoacide, noctropic, antidaterial fungicides, nucleic acid molecules and antibodies are useful for the manual acture of a medicament for treating any have a use artilipaemic activity. A polypeptides nucleic acid molecules and antibodies are useful for treating, preventing or diagnosing diseases und antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders. CC disease, parting or diagnosing diseases such as metabolic disorders, including and protozoal), anoroxais, cancer, cardiovascular diseases (hypertension, atherosclerosis) neurodegenerative disorders, including, and various dyslipidaemias. The nucleic acid and oblypeptides and antibodies are disorders (astease, partinon) a disease, epilepsy, immune disorders, in generation, and various dyslipidaemias. The nucleic acid and oblypeptides are targets for the identification of small molecules are further used as targets for the identification of small molecules or inhibit e.g. neurogenesis, and pharmacogenesis, in generation, haematopolesis, wound healing and angiogenesis, in generation, haematopolesis, molecules, polypeptides of the inventive medicine and protope, preventive medicine and protope, preventive medicine and protope, in chromosome mapping, preventive medicine and protope, in chromosome mapping, preventive medicine, and pharmacogenomics. The NOVA cleases though to mology to fibroblast growth factor receptor (FGF4), NOVAs allows homology to fibroblast growth factor along shows homology to matrix metalloproteinase. Superpride variant; NOVAs and show homology 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CSFRELLLEDGYNVYQSEAHGLPLHLPGNKSPHRDPAPRGPARFLPLPGLPPALPEPPGI 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

tag from a human prostate tumour library which coded for a novel
hypothetical signal peptide. Further analysis led to the identification
of JAPPA. The invention provides JAPPA polypetides, polymicleotides and
anti-JAPPA antibodies. It also provides antisense nucleic acid molecules,
crecombinant expression vectors, host cells and transgenic animals. JAPPA
proteins may be useful for developing novel diagnostic and therapeutic
proteins may be useful for developing novel diagnostic and therapeutic
which demonstrate ABO(H) blood group disorders and other disorders
which demonstrate ABO(H) blood group disorders and for controlling
cellular proliferative and/or differentiative disorders. The JAPPA
cellular proliferative such as autoimmune disease and multiple sclerosis.
The proteins may also be used to screen for naturally occurring JAPPA
substrates, to screen for drugs or compounds which modulate JAPPA
substrates, to screen for drugs or compounds which can be used to detect
and isolate JAPPA proteins, regulate the bioavailability of JAPPA
proteins and modulate JAPPA activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

Novel sbgFGF-19a polypeptide, a member of fibroblast growth factor family and polynucleotides encoding them useful for diagnosing, treating stroke, psoriasis, cancer, atherosclerosis, rheumatoid arthritis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 LEIREDGTVGGAADQSPESLLQLKALKRGVIQILGVKTSRFLCQRPDGALYGSLHFDPEA 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polypeptide is a member of fibroblast growth factor family of polypeptides. The polynucleotides and polypeptides are useful in the treatment of diseases such as stroke, traumatic brain injury, cerebral schemia, cancer, atherosclerosis, rheumatoid arthritis, cirrhosis, psoriasis, sarcoidosis, idiopathic pulmonary fibrosis, tumour developmental disorders, skeletal disorders, wound repair, and acrocephaly. They are also useful as vaccines for inducing an immunological response in a mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MDSDETGFEHSGLWVSVLAGLLLGACQAHPIPDSSPLLQFGGQVRQRYLYTDDAQQTEAH

polypeptide. FGF-like protein and its associated mucleic acid play a role
in modulating body growth, maturation or life span. They are also useful
for treating, preventing or ameliorating disorders such as cirrhosis,
inflammatory bowel disease, mucositis, Crohn's disease, diabetes,
obesity, gastrointestinal abnormalities, neurodegenerative diseases,
damage to renal tubules as a result of acute tubular necrosis,
haematopoietic cell reconstitution following chemotherapy, wasting
syndromes (e.g., cancer associated cachexia), damage to the corneal
syndromes (e.g., cancer associated cachexia), damage to the corneal
cature, delayed maturation, excessive growth (e.g. acromegaly),
premature maturation, alopecia, abnormalities of adrogen target organs,
premature maturation, alopecia, abnormalities of adrogen target organs,
promchopulmonary displasia, acute respiratory distress syndrome, tumours
of the eye or other tissues, atherosolesosis, hypercholesterolemia,
stroke, osteoporosis, osteoarthritis, muscle atrophy, sarcopenia,
chaldness, wrinkles, increased fatigue, decreased teamina, decreased
cardiac function, immune system dysfunction, cancer, Parkinson's disease,
senile dementia, Alzheimer's disease, and decreased cognitive function

                                                                                                                                                                                                                                                                                                                                                                                                    Zhong M,
```

Claim 1; SEQ ID NO 56; 214pp; English.

acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The NOVX polypeptides of the invention show homology to certain known human proteins: NOVIa-1t show homology to fibroblast growth factor receptor

```
(FGFR4); NOV2a shows homology to complement factor I precursor; NOV3a shows homology to matrix metalloproteinase-15 precursor; NOV4a shows homology to MCS4. NOV5a-5c show homology to T-1ymphocyte surface antigen Ly-9 precursor; NOV6a-6m show homology to fibroblast growth factor-21 (FGF-21); NOV7a-7c show homology to alpha-2 macroglobulin-like procursor; NOV9a-9i show homology to alpha-2 macroglobulin-like precursor; NOV9a-9i show homology to LIV-1 protein; NOV10a shows homology to nuclear hormone receptor NOR-1; NOV1a-11j show homology to beta-necendorphin transmembrane protein-like; NOV12a-12c show homology to beta-necendorphin developments of the present sequence represents a NOVX polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      LEIREDGTVGGAADQSPESLLQLKALKPGVIQILGVKTSRFLCQRPDGALYGSLHFDPEA 120

present sequence is human FGF-21 protein which is a member of the FGF

The

```
The invention relates to fibroblast growth factor (FGF)-like polypeptides and nucleic acid molecules encoding such polypeptides. Sequences of the invention are useful for treating dermal wounds, epidermolysis, condition. They are useful for treating dermal wounds, epidermolysis, bullosa, male pattern alopecia, gastric ulcer, duodenal ulcer, erosive condition. They are useful for treating dermal wounds, epidermolysis, bullosa, male pattern alopecia, gastric ulcer, duodenal ulcer, erosive contists, chempers, inflammatory bowel disease, ccom, sintensmatory bowel classas, to contist, pulmonary fibrosis, pulmonary fibrosis, contral hepatitis, mucositis, multiple sclerosis and other viral hepatitis, mucositis, multiple sclerosis and other currhosis, toxic insults to the liver, fulminant liver failure, viral hepatitis, diseases, infantile respiratory distress syndrome, concompulmonary dysplasia, acute respiratory distress syndrome, concompulmonary dysplasia, acute respiratory distress syndrome, concompulmonary dysplasia, acute respiratory distress syndrome, concompulmonary dysplasia, enthe respiratory distress syndrome, concompulmonary dysplasia, acute respiratory distress syndrome, concompulmonary dys

bowel disease such as Crohn's disease, hyaline membrane disease of premature infants, smoke inhalation, emphysema, hepatic cirrhosis and thymic epithelial atrophy. The nucleic acids may also be used to map locations of FGF-like gene and related genes on chromosomes. The present sequence represents a human FGF protein.

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, cardiant, hypotensive, antiarteriosclerotic, anorectic, virucide, antibacterial, fungicide, protozoacide, noctropic.

CC virucide, antibacterial, fungicide, protozoacide, noctropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antiarthritic, antimifarmancy, dermatological, antiaschmatic, and antibodies antiarthritic, antimifarmatory, dermatological, antiaschmatic, and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder.

CC antilipaemic activity, A polymucleotide of the invention may have a use insecting, preventing or diagnosing diseases such as metabolic disorder.

CC The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorder.

CC The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases (viral, bacterial, fungal, bacterial, fungal, bacterial, and protozoal), anorexia, cancer, cardiovascular disorders, disease, Parkinson's disease, epilepsy immune disorders

CC disease, Parkinson's disease, epilepsy; immune disorders

(ostecoarthritis), hematopoletic disorders, inflammatory skin disorders asthma, and variuos dyslipidaemias. The nucleic acids and polypeptides of the impublic e.g. neurogenesis, cell differentiation, cell proliferation of antibodies that bind immunospecifically to Novx substances for use in therapeutic or diagnostic methods. The novel contains novel proteins novel propessing section in the propessing preventive medicine, and pharmacogenomics. The NoVX substances homology to conflement factor I precursor; NOV3 shows homology to complement factor I precursor; NOV3 shows homology to complement actors. I precursor; NOV3 shows homology to co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ly-9 precursor; Nov6a-6m show homology to fibroblast growth factor-21 (RFF-21); NOV7a-7-c show homology to alpha-2 macroglobulin-like polypept); NOV7a-7-c show homology to antileukoproteinas 1 precursor; NOV9a-9; show homology to LIV-1 protein; NOV10a shows homology to LIV-1 protein; NOV10a shows homology to LIV-1 protein; NOV10a shows homology to change at hormone receptor NOX-1; NOV11a-11; show homology to transmembrane protein-like; NOV12a-12c show homology to beta-necendorphin dynorphin precursor. The present sequence represents a NOVX polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             126

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, anorectic, cardiant, hypotensive, antiatreriosclerotic, anorectic, anorectic, virucide, antibacterial, fungicide, protozoacide, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antiathritic, antifilammatory, dermatchogical, antisathmatic, and antipaemic activity. A polypuclectide of the invention may have a use in gene therapy. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders, treating, preventing or diagnosing diseases (viral, bacterial, fungal, chalminthic, and protozoal), anorexia, cancieve, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders
                                                                                                                                               human; antidiabetic; anorectic; cardiant; hypotensive; antiarteriosclerotic; anorectic; virucide; antibacterial; fungicide; protozoacide; nootropic; neuroprotective; antiparkinsonian; anticonvulsant; osteopathic; antiarthritic; antiinflammatory; dermatological; antiasthmatic; antilipaemic; gene therapy; fibroblast growth factor receptor 4; FGFR4; complement factor I precursor; matrix metalloproteinase-15 precursor; MDC3; T-lymphocyte surface antigen by-9 precursor; fibroblast growth factor-21; FGF-21; antileukoproteinase-15 precursor; alpha-2 macroglobulin-like polypeptide variant; antileukoproteinase 1 precursor; LIV-1; nuclear hormone receptor NOR-1; transmembrane protein-like; beta-neoendorphin-dynorphin precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rieger DK;

Cubercontinitis), insequency cases. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, would healing and angiogenesis, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The NOVX polypeptides of the invention show homology to certain known human proteins NOV1a-it show homology to certain known human proteins NOV1a-it show homology to cortain known human proteins NOV1a shows homology to complement factor I precursor; NOV3a shows homology to matrix metalloproteinse-15 precursor; NOV4a shows homology to matrix metalloproteinse-15 precursor; NOV4a shows homology to MDC3; NOV5a-5c show homology to fibroblast growth factor-21 (FGF-21); NOV7a-7c show homology to fibroblast growth factor-21 (FGF-21); NOV7a-7c show homology to fibroblast growth factor-21 precursor; NOV9a-9i show homology to intleave antigen precursor; NOV9a-9i show homology to intleave antigen precursor; NOV9a-9i show homology to intleave antigen precursor; NOV9a-9i show homology to intleave homology to nuclear hormone receptor NOV1a-12c show homology to beta-necendorphin grecursor. The present sequence represents a NOVX polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the pecification. A polypeptide of the invention has antidiabetic, anorectic, cardiant, hypotensive, antiarteriosolated, nootropic, virucide, antibacterial fungicide, protozoacide, nootropic, antiarthritic, antiinflammatory, dermatological, antiasthmatic, antilinflammatory, dermatological, antiasthmatic, antilinflammatory, dermatological, antiasthmatic, antilinflammatory dermatological, antiasthmatic, and use therapy. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicannet for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obssity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, alsease, parkinson's disease, epilepsy, immune disorders, alsease, epilepsy, immune disorders, achimatopoletic disorders, and various dyslipidaemias. The nucleic acids and polypeptides and antibodic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in generation of antibodies that bind immunospecifically to NoVX substances for use in therapeutic or diagnostic methods. The mucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The NoVX polypeptides of the invention show homology to certain known human proteins: NoV1a-1t show homology to fibroblast growth factor receptor (FGFR4); NOV2a shows homology to complement factor I precursor; NOV3a shows homology to complement factor I precursor; NOV3a hows homology to complement factor I precursor; NOV3a how homology to T-1ymphocyte surface antigen Ly-9 precursor; NOV5a-5c show homology to fibroblast growth factor-21 (FGFR21); NOV7a-7c show homology to fibroblast growth factor-21 (FGFR21); NOV7a-7c show homology to fibroblast growth factor-21 (FGFR21); NOV3a-8g show homology to antileukoproteinase 1 precursor; NOV9a-9i show homology to antileukoproteinase 1 precursor; NOV9a-9i show homology to contileukoproteinase 1 precursor; NOV9a-9i show homology to contileukoproteinase 1 precursor; NOV9a-9i show homology to contileukoproteinase 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 to nuclear hormone receptor NOR-1; NOV11a-11; show homology to transmembrane protein-like; NOV12a-12c show homology to beta-neoendorphin dynorphin precursor. The present sequence represents a NOVX polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Zhong M, Guo X, Anderson DW, Ort T, Padigaru M, Rieger DK;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1; SEQ ID NO 66; 214pp; English.

creet stem cells and neuronyles, neural tune-derived stem cells, neural creet stem cells and neuronyles, neural tune-derived stem cells and neuronyles, neural tune-derived cells and endothelial cells and inhibiting chondrosarcomas, atherosclerosis restenosis and obseity. Stimulation of Gateoblasts results in bone formation useful for treating bone defects, fractures, ceteoporosis and other deficiencies in bone structure and formation.

Steppil is useful for treating disorders associated with diabetes mellitus, neural cell development or degeneration, amyotrophic lateral sclerosis, cerebrovascular stroke, neuropathy associated with lack of maintenance of neuronal differentiation and congenital disorders of the nervous system or lack of neuronal development, promoting anglogenesis and wound healing, for revascularisation in eye, complications related to poor circulation such as diabetic food ulcers, improving cardiac to reduce damage to the tissue caused by ischaemia or ischaemia-reperfusion events, particularly in the heart or brain and for inducing skeletal muscle neogenesis and/or hyperplasia, kidney regeneration and/or for treating of systemic and pulmonary hypertension. Antagonists of zPGF11 are useful for inhibiting disorders associated with kidney epithelium cut as glomerulonephritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              141

stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating or inhibiting the proliferation of normal human dermal fibroblast cells. The PRO polypeptide may also be used as molecular weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. AAU83592-AAU83713 represent human PRO protein sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                141
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             140

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polymucleotides encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in pericyte cells, for stimulating the proliferation or differentiation of chondrocyte cells for
